

Postdoctoral Position in Ocean Modelling – Climate Change Downscaling

Laboratoire de Physique des Océans
UMR 6523 CNRS-IFREMER-IRD-UBO, Brest, France

We invite applications from talented and motivated candidates interested in pursuing their research in coastal oceanography, with focus in downscaling global climate change scenarios in relation with regional ecosystems evolution. The successful applicants will participate in a new project funded by the European Community.

The European FP7 MEECE (Marine Ecosystem Evolution in a Changing Environment) project will address global change, the result of natural and anthropogenically induced climate change impacts upon the structure and function of marine ecosystems via a number of abiotic and biotic drivers.

The specific goals of MEECE are :

- To improve the knowledge base on marine ecosystems and their response to climate and anthropogenic driving forces ;
- To develop innovative predictive management tools and strategies to resolve the dynamic interactions of the global change driver, i.e. changes in ocean circulation, climate, ocean acidification, pollution, overfishing and alien invasive species on the structure and functioning of marine ecosystems.

To achieve these goals, MEECE will employ a combination of data synthesis, numerical simulations and targeted experimentation. An increase in the knowledge base and predictive capacities regarding the influence of the drivers is central to the successful fulfillment of the goals of the European Marine Strategy.

The offered post-doctoral position is part of this MEECE project led by Dr Icarus Allen at Plymouth Marine Laboratory, United Kingdom, which will extend from 2008 till 2012.

Within the “Ecosystem response to climate scale drivers” Work Package, the candidate will have to perform regional coupled physical simulations in the Benguela upwelling region that will successively be applied to study the evolution of the regional ecosystem. The ROMS physical model will be used to simulate the hydrodynamics and thermal structure. The SAFE (South African Experiment) configuration (1/4°) in which is embedded a refined zoom (1/12°) of the Benguela upwelling system will be run in scenarios. The post-doctoral work will be intended to develop the best « downscaling » techniques to regionalize the climate change signal simulated by the IPCC AR4 climate models. Preliminary tests have been already performed and the following on approaches will be discussed with the successful candidate.

Some questions to be addressed:

- What are the consequences of the climate changes on the physical behaviour of the open ocean and local upwelling system ?
- What are the possible impacts on the biogeochemical cycles and regional ecosystem ?

A recent PhD in physical oceanography or a related field is required. The applicant should have a strong background in geophysical fluid dynamics and numerical modelling.

Letters of application, a C.V., a short statement of research interests and the name of two referees should be sent by January 15, 2009 to sabrina.speich@univ-brest.fr (S. Speich, Laboratoire de Physique des Océans (LPO), UMR6523 CNRS/IFREMER/IRD/UBO, <http://www.ifremer.fr/lpo/speich>, Université de Bretagne Occidentale - UFR Sciences, 6, av Le Gorgeu C.S. 93837, 29238 Brest Cedex 3 France).

Appointment will be for a 12-month duration and may start February 1st, 2009 or later. Annual income will be 24,000 Euros.
